Bird Watching

Evolution Fact!

Over the last few million years, the Hawaiian honeycreepers (more than 50 species) are believed to have “evolved” from just one finch-like couple!

Today, so many honeycreepers are extinct—gone forever. But some still live in Hawai‘i’s native forests.

The ‘iwi is a most attractive, and still common honeycreeper.

Can you label the parts of the ‘iwi?

breast
tail feathers
back
throat
crown
ear
nostril
belly

Color me in red with a black wing and tail. My beak and legs are orange.

‘iwi
